Geology	
Provide the four geologic site models.	
Expansive Clays	
Expansive clay is defined as soil having a weighted plasticity index greater than 15 as defined by Building Research Advisory Board (BRAB) or a maximum potential swell greater than 1 percent.	
Faults Escarpments	
Growth faults - slow moving faults that have deep seated salt formations shear failure. This is very prevalent in the Houston, Texas area.	
Ground Water -	
Perched Water Conditions - intermediate saturated flows above near-surface impervious layers. Use illustration Figure 8.1 in P.B. Attewell and I.W. Farmer "Principles of Engineering Geology."	
Grades	
Slope stability	
Types of slope failure - Planar shear - usually along discrete boundaries, such as contact points between formations. Circular failure - Deep seated failure of homogeneous solids that are relatively unaffected by bedding. Modified Circular failure - Modified by a stratum boundary. Wedge Type Failure - combined planar in a circular failure pattern. Use illustration Figure 9.1 in P.B. Attewell and I.W. Farmer "Principles of Engineering Geology."
